

PRODUCT BRIEF

HEYCLICKY × CONSTRUCTION

UNTAPPED VERTICAL

The site engineer has no **AI buddy**. Yet.

A use case brief for HeyClicky – written by someone who has lived the problem firsthand on Nigerian construction sites.

01 – THE PROBLEM

Documentation is killing site engineers

Every day on an active construction site, a QS or site engineer is managing one of the most information-dense jobs in the world – material quantities, structural drawings, casting records, labour logs – often across multiple supervisors and with zero standardisation.

REAL WORKFLOW – MINISTRY OF WORKS, NIGERIA

"I'd capture everything in phone notes on-site – quantities of columns cast, beams poured, stairs completed. Then I'd go back to the office and rewrite it all from scratch into reports. Not once. Multiple times. Each supervisor wanted their own version with no shared template. Same data, different documents, every single day."

This isn't a Nigerian problem. It's a global construction industry problem. And it is completely unsolved.

02 — WHY THIS MARKET

Millions of professionals. Zero AI tooling.

HeyClicky is already seeing traction with doctors, founders, and creators — professionals who work on screens with high cognitive load. Construction engineers fit exactly that profile. The difference is nobody has gone after them yet.

And critically — this market is strongest in Africa, the Middle East, and South/Southeast Asia. Markets that are invisible from San Francisco but represent the majority of global construction activity.

03 — THE USE CASE

Clicky as your site documentation co-pilot

Here is the exact workflow HeyClicky would transform:

1

End of casting — data is scattered across phone notes

Engineer has notes like: "Col C3 × 4, 300×300, floor 2.
Beam B7 × 2, 230×450." Messy. Informal. Accurate.

2

Engineer opens laptop — Clicky sees the screen

Clicky sees the phone notes or typed raw data on screen.
Engineer says: "Clicky, turn this into a daily casting
report."

3

Clicky generates the structured report instantly

Formatted table: element type, grid reference, dimensions,
quantity, floor level, date. Professional. Ready to submit.

4

Multiple supervisors? One command.

"Clicky, now reformat this for the Project Manager's weekly
summary." Same data. Different structure. Done in seconds.

5

Cumulative tracking over time

Clicky agent tracks totals across days — total columns cast
this week, variance against programme, running material
tally.

04 — IN PRACTICE

What it actually sounds like

LIVE SCENARIO — SITE OFFICE, 6PM AFTER CASTING

ENGINEER

"Clicky, I've got today's casting notes open. Col A1 to A4, 300×300, ground floor. Two beams on gridline 3, 230×450. Three staircase waist slabs. Generate me a casting record."

CLICKY

Generated. Daily Casting Record – [Date]. 4 columns, Grid A1-A4, 300×300mm, GF. 2 beams, Gridline 3, 230×450mm, GF. 3 staircase waist slabs. Total concrete elements: 9. Want me to add this to your running weekly total?

ENGINEER

"Yes. Also make a separate version for the Resident Engineer – he wants it with remarks column and a footer."

CLICKY

Done. Two versions ready – standard and RE format with remarks column and project footer. Shall I save both?

05 – FEATURE BREAKDOWN

What needs to be built

Voice-to-report

Dictate raw site notes out loud. Clicky structures them into a formatted casting or material record automatically.

Multi-format output

Same underlying data → reformatted per supervisor preference. Engineer defines each supervisor's format once.

Cumulative tracking agent

Background agent accumulates daily records into weekly and monthly summaries. Flags variance against programme.

Drawing-aware Q&A

Clicky sees a structural PDF open on screen. Engineer asks "how many columns on this floor?" – Clicky reads and answers.

06 – WHY I'M SENDING THIS

What I bring that nobody in SF does

"I have stood on a construction site in 35°C heat, phone in hand, capturing quantities of freshly cast concrete because there was no better system. I have gone back to a site office and rewritten the same data four different ways for four different supervisors before I could go home. I know this problem from the inside."

– Wick, BTech Quantity Surveying, FUTMinna | Internship: Al-Mansour Engineering & Ministry of Works, Nigeria

I'm not a senior engineer. I don't have a polished portfolio. But Farza said in 2026 he indexes on ideas – and this idea comes with something most pitches don't: direct, lived experience of the exact pain the product would solve.

I'm also an active forex and crypto trader with a working knowledge of chart analysis, risk management, and prop firm frameworks – which opens a second vertical (Clicky for traders) that I'm happy to brief separately.
